

Rogue Deterministic Agent - Continuation-in-Part Disclosure

Date: 14 December 2025

Inventor: Stephen Zeitvogel

Parent Provisional: 63/864,057

1. Technical Abstract

Rogue Enterprise is the first fully on-premise agentic stack that couples (i) a cryptographically signed flight-recorder (deterministic replay), (ii) hardware-rooted trust (TPM PCR-17), and (iii) equity-coupled governance (on-chain tokens).

All source files referenced below are dedicated to the public domain under CC0 1.0 Universal; the **patent claims** remain reserved for continuation-in-part filing.

2. Code Bundle (public-domain reference implementation)

Copy

agent_blackbox/

├─ core/

│ └─ wal.py - append-only SQLite WAL with Ed25519

signatures

│ └─ epoch.py - mission UUID + deterministic code-hash

│ └─ dom_snap.py - capture/restore DOM + storage

│ └─ ctrl.py - PAUSE / RESUME / REWIND RPC server

├─ browser/

│ └─ content.js - Chrome extension mutation capture

│ └─ panel.html - DevTools-style timeline viewer

├─ example/

│ └─ demo_agent.py - end-to-end deterministic demo

└─ requirements.txt - pynacl, selenium, flask

3. New Patent Claims (to be added to CIP)

Claim 1 - Legally-Admissible Consensus Artifact

A method wherein three locally sandboxed LLMs emit answer objects; a Convergence Arbiter SHA-256 hashes the concatenated replies plus a monotonic mission-ID, signs the digest with Ed25519, and stores the blob in an append-only SQLite WAL flushed before any user-facing output, yielding a tamper-evident exhibit admissible under FRE 902(13).

Claim 2 - Equity-Coupled Permission Bits

A computer-readable medium storing a 64-bit permission vector whose individual bits map 1-to-1 to equity-class records in a Delaware-corporation cap-table smart-contract on an EVM side-chain; the agent refuses tool invocation until the corresponding equity-mint transaction is ≥ 6 blocks deep, fusing capital formation with AI capability invocation.

Claim 3 - Cryptographic Clean-State Boot

A hardware-rooted method that (i) performs Intel TXT measured launch, (ii) extends TPM PCR-17 with a SHA-256 hash of the RogueOS kernel plus Tri-Agent image, (iii) compares the PCR value to a golden measurement in the Builder's-Permit license, and (iv) on mismatch triggers a Bunker-Buster routine that NVMe-secure-erases all partitions, re-images the host from a read-only ISO, and re-measures until PCR match, guaranteeing a deterministic clean-state.

Claim 4 - Remote-Attestation Clone Resistance

A system-call interceptor that hooks the agent's HTTP client; before each outbound request the interceptor demands a TPM quote of PCR-17, sends the quote to a license oracle, and injects the returned time-bound JWT as a bearer token; if the quote does not match the licensed measurement the oracle withholds the JWT, aborting the request and rendering forked binaries inoperative.

4. License

All source code in §2 is dedicated to the public domain under CC0 1.0 Universal; no copyright is asserted. The patent claims in §3 are reserved for formal USPTO filing.
